

Get it all in one. All the protection of a chimney cap plus the savings of a damper.

Cap-Damper with part of screen removed to aid viewing of the damper mechanism.

A chimney is designed to pull warm gases out of the firebox and exhaust it outside. A damper is designed to seal the chimney when it's not being used to burn a fire. If the chimney is not sealed when not in use, it still pulls the warm gases from the fire box, only now it is the warm air your furnace created. This is very expensive!

Guarantee

Chimney Top Damper
Lifetime Guarantee against defects in material and workmanship.

- * Guarantee is rendered void in the event of a chimney fire or the burning of anything other than firewood, firelogs or gas logs.
- * Burning of plastics, trash, paper, chemically treated or painted wood can produce chemical reactants that can destroy the metal parts of a chimney and eat away the masonry structure.
- * Chimney fires can reach temperatures of 1500 to 2000 degrees. Consult with your chimney sweep on how often you should have your chimney cleaned.

You could be losing **\$350.00** or more out of your chimney, every year, without even knowing it!

Huge heat loss occurs when a chimney's damper doesn't seal properly or is missing or broken. You can't see it, the heat just goes out of the house. If your chimney's damper isn't sealing properly it's like *leaving the front door open in the middle of winter!*

A simple, cost effective solution.
The "Ice Breaker" top sealing
Chimney Cap-Damper.

All 304 Stainless
Steel Cap-Damper

Special 7x7 strand stain-
less steel aircraft cable
runs inside the flue!

Simple to operate
handle right in the
living room.

We tested our damper by
freezing it with dry ice down
to **-109°F**.

IT OPENS EVERY TIME!

(We cut the screen away so
you could see inside.)

You can still service the chimney
from the top with this damper!
All you do is take the lid off.

The main purpose of a damper is to seal the chim-
ney when it is not in use. Heat rises, and if the chim-
ney is not sealed when the fireplace is not in use, all
the heat in the house goes up the chimney

The normal damper that comes with a chimney is
hard to operate, buried high up in the throat of the
fireplace. Even if you know why you should use it,
how to use it, and where it is, it's normally not done
because it is difficult and **dirty**.

Why put up with it?

Why not realize the savings on your fuel bill? Why
let your home be cold and drafty? Why make it a
chore to open the damper to have a fire or to close it
after one?

With the "Ice Breaker" **top-sealing damper** your
Chimney Sweep can change all this in a few minutes.

Easy to use, convenient, and clean, it will actually
be used to seal the chimney when the fireplace is not
in use. It will probably pay for itself in the first year
from the decrease in your utility bills, not to mention
the increase in the comfort level of your home!

You wouldn't leave a window open in the middle of
winter because it's cold outside. The same thing hap-
pens with an open damper, only you can't see it.

How hard is the "Ice Breaker" top-sealing damper
to use? Michael is 3 and he can open and close it!
